

Abstract of the Disclosure

Routing a message (e.g., text message, voice message, etc.) based on the accessibility of an intended recipient's associated communication channels (e.g., email, fax, instant message, cell, landline, etc.) may involve discovering information relating to an accessibility state of one or more communication channels associated with the message recipient; maintaining a data repository comprising the discovered accessibility state information; and routing a message to the message recipient based on information in the data repository.
